MỤC TIÊU NGHỀ NGHIỆP

Backend Software Engineer with 9 months of experience in the enterprise software domain. Dedicated to engineering robust and secure backend architectures using Java. Possesses a strong foundation in Object-Oriented Programming (OOP) and Design Patterns. Looking for a role to grow and contribute to impactful, production-ready software development.

HỌC VẤN

FPT University 2022 - 2026

Software Engineering

- Spearheaded major academic projects as Team Leader, overseeing task allocation, code quality, and timely delivery.
- Completed rigorous coursework in Data Structures and Algorithms, Enterprise Web Applications, and Software Architecture and Design.

KINH NGHIỆM LÀM VIỆC

FPT Information System 1/2025 - 9/2025

Software Engineer Intern

- Contributed to enterprise applications using Java Spring Boot for backend.
- Mentored by senior engineers in the practical implementation of Docker and CI/CD pipelines within Azure environments.
- Participated in the full Software Development Lifecycle, adhering to professional coding standards and Agile methodologies.
- Gained pportunity to explore the codebase of an Open Banking system by tracing API request flows through layers of code, obtaining a practical understanding of enterprise-grade Spring Boot project structures.

DỰ ÁN

Primary School Operation System 11/2025 - 4/2026

Group Project - Capstone

- Tech stack: React.js, .NET 8 (ASP.NET Core), and SQL Server.
- Architected and developed a secure, scalable backend using ASP.NET Core to serve RESTful APIs.
- Implemented user authentication and authorization using JWT.
- Built a dynamic and responsive frontend using React.js to create an interactive user interface.

BurstSlot - Slot Reservation System 3/2026 - 5/2026

Personal Project

URL: https://github.com/tranhuytoan161104/BurstSlot.git
This project employs an enterprise-level stack only to study and do hand-on practice complex system challenges (e.g high-concurrency handling, fault tolerance, and data integrity), rather than broad features development or show off tech-stack.

- Tech stack: Java Spring Boot, PostgreSQL, Redis, Apache Kafka, Docker, k6.
- Resolved lost update and overselling race conditions using Atomic SQL Updates in PostgreSQL.
- Prevented connection pool exhaustion via a Redis to proactively handle traffic spikes.
- Eliminated dual-write anomalies during system crashes using the Transactional Outbox Pattern and Apache Kafka.
- Validated architectural bottlenecks and throughput improvements via k6 load testing.
